The feature can also link to a website where your collaborative viewer can view your projects. As for laptops, I still use Windows 7, but I'm starting work in Aquia Designer again after using Luxon Designer for the last few years. I'm still editing my photographs in Lightroom 2.5.6 with a MacBook Air (5,1). I usually use a Nikon D3 for travel and a D800 for shoots in the field (or on assignment). Small photo editing issues aside, I've generally been enjoying using Lightroom. I hope that the forthcoming Lightroom 5 Server edition will have some of the outstanding design features not available in the Lightroom 5 Consumer version. I would like to see Retouch and Red Eye Reduction options, a large view of the image without zooming in to select an area, and an option to add color casts to selected areas of an image. As for menus, the dividing lines are much less defined. Photoshop's menus are intended to facilitate the transition to the next version of Photoshop. Instead of iteratively changing existing elements, Photoshop menus change and new and/or rearranged elements are introduced as new features age. Another advantage to having Adobe continue to encapsulate its features in its own applications is that it gives designers and photographers more of their own creative space when working with other Adobe programs.

The point of intersection between all of these new features is that Photoshop CC is extremely accessible to artists in all design industries around the world. However, this accessibility comes at the cost of a steep learning curve . The software was originally known as The Nullsoft Scripting Language (NSCRIPT) and started as a proprietary scripting language for The Nullsoft Document Systems NDS-1. NDS was developed at the direction of Jim Clark, the chairman and CEO of the Digital Equipment Corporation, who had started the company in the 1970s. The script language was created to help automate the creation and modification of the proprietary corporation's "NDS Document Systems". With the ability to directly programming Photoshop scripts, the developer can now automate almost any Photoshop task. In fact, it's even possible to automate sending email and getting return receipt notifications. Scripts can be written either from native Photoshop commands, from an external text file, or from an XML file. For example, the Photoshop scripts can be made to loop through an image collection, place a web link and a text string of a specific color (for example) at a specific point (say, the bottom left corner of the image, with a given width and height), add a watermark to a client logo, etc. For a more complete introduction to Photoshop scripting and the current features available, look at the recent Photoshop docs found under Help=Photoshop Help Database: Photoshop scripting | [Help docs](#).
